Introduction to mobile devices

CS 436 Software Development on Mobile

By Dr. Paween Khoenkaw

Welcome to the world of smart devices

http://www.rudebaguette.com/2014/02/13/mobile-smart-devices-set-drive-turnaround-frances-tech-device-market/

The fist telephone

March 10th 1876 see you . To my delight he came and declared That he had heard and understord what I said, I asked him to repeat the words - the mint He answered you said M. Watson - come here Meceiving Just I want to see you " We Then changed places and I listened at S while Watson read a few passages from a book into the brausmitting lack month piece M. It was certainly the case That articulate sounds proceeded from S. The effect was loud but indistinct and muffled . 1. The improved instrument shower in Fig. I was If I had read beforehand The passage given constructed this morning and tried this lovening . P is a brass pipe and W The platimum wire by W- Watson I should have recognized M the month piece and S The armatine of every word. Is it was I could not make out The sense - but an occasional The Receiving Instrument. M. Watson was stationed in one room word here and there was quite distinct. I made out to and "out" and further"; with the Receiving Instrument . He pressed one ear closely against S and closely his other and finally The sentence " Mr. Bell Do you ear with his hand. The Transmitting Instrument understand what I day? Do- you - un was placed in another room and the doors of der - stand - what - I - Day " came quite clearly and intelligitly. hosound both rooms were closed. Then should into M the following was audible when the armatuse S was resentence; "W" Watson - Come here - I want to noved -

Bell's March 10, 1876 laboratory notebook entry describing his first successful experiment with the telephone.

We make a phone call to a place

Mobile phone generations

O G The early mobile phones

Car phone service originated with the Bell System, and was first used in St. Louis on June 17, **1946**. The original equipment weighed 80 pounds (**36 kg**), and there were initially only **3** channels for all the users in the metropolitan area

The first hand-held mobile phone

Martin Cooper and DynaTAC

On April 3, **1973** Cooper and Mitchell demonstrated two working phones

Cooper dialed the number of his chief competitor Dr. Joel S. Engel, who was head of Bell Labs. "Joel, this is Marty. I'm calling you from a cell phone, a real handheld portable cell phone."

1G Cellular Phones

1979

NMT – Nordic Mobile Telephony

AMPS - Advanced Mobile Phone System

TACS – Total Access Communication System

ETACS – Total Access Communication System

- Analog System
- Low capacity
- Do not coverage long distance
- Not Secured

Connected PCs

Digital baseband

Interactive Pager

Launched by RIM in 1996. It specialized in two-way messaging and had limited HTML access, though it was e-mail capable.

Internet on the move

Wireless Application Protocol (WAP) + General packet radio service (GPRS)

Mobile Programming Language

2.75G GSM Phone

- GSM **Global System** for Mobile Communications
 - Digital voice communication
 - Coverage long distance
 - Globally Accepted (roaming)
 - Short Message
 - Secured
 - Data Channel
 - GPRS (General Package Radio Service)
 - EDGE (Enhance Data rates for GSM Evolution)@170kpbs

2G CDMA Phone

- CDMA (Code-division multiple access)
- SSMA (spread-spectrum multiple access)

3G GSM Phone with Faster Data

2007

- UMTS (Universal Mobile Telecommunication System) @384kbps
- Video Calling

- 1Gbps for Stationary users
- 100Mbps for High mobility users (Bullet train)

3.5G GSM Phone with Faster Data

- HSDPA (High Speed Downlink Packet Access)@2Mbps

- HSUPA (High Speed Uplink Packet Access)@2Mbps

3.75G GSM Phone with Faster Data

- HSPA+ (Evolved High Speed Packet Access Plus)
- Downlink@42.2Mbps
- Uplink@22Mbps

3.9G GSM Phone with Faster Data 2009

4G LTE phone: Samsung Galaxy S Aviator Android 2.3 2012

- LTE (Long Term Evolution)
- 4G LTE
- Downlink @ 300Mbps
- Uplink @ 75Mbps

3G W-CDMA Phone

- W-CDMA Wideband Code Division Multiple Access
- CDMA2000
- EVDO (Evolution-Data Optimized)

4G Fast Data

In 2011, Thailand's Truemove-H launched a pre-4G HSPA+ network with nationwide availability.

- LTE (Long Term Evolution)
- 4G LTE
- LTE Advanced
- 4G Voice call
- Fall back to 3G for voice calling
- Downlink @1000Mbps
- Uplink @ 500Mbps

5G Fast Data + Low latency

1.Speed: 5G can offer download speeds up to 10 Gbps

2.Latency: 5G has much lower latency. This is crucial for applications like autonomous driving

3.Capacity: 5G can support a larger number of devices connected to the network simultaneously

4.Reliability: 5G networks are designed to be more reliable

ADD	rmw,ib	83	/0	d0	d1	i0		ΕW	3~5	oszap
ADD	rmb,rb	00	mr	d0	d1			В	2~4	oszap
ADD	rmw,rw	01	mr	d0	d1			W	2~4	oszap

Usage

dest, src

ADD

Modifies flags

AF CF OF PF SF ZF

Adds "src" to "dest" and replacing the original contents of "dest". Both operands are binary.

Intel8086

The one instruction is doing many operation

The complex operation was done in a single instruction

Program is simple to write Fewer instruction = Program run faster

Complex Instruction Set Computer

x86 integer instructions [edit]

This is the full 8086/8088 instruction set of Intel. Most if not all of these instructions are available in 32-bit mode; they just operate on 32-bit registers (**eax**, **ebx**, etc.) and values instead of their 16-bit (**ax**, **bx**, etc.) counterparts. See also x86 assembly language for a quick tutorial for this processor family. The updated instruction set is also grouped according to architecture (i386, i486, i686) and more generally is referred to as x86 32 and x86 64 (also known as AMD64).

Original 8086/8088 instructions [edit]

Original 8086/8088 instruction set

Instruction +	Meaning 🔶	Notes +	Opcode 🗢
AAA	ASCII adjust AL after addition	used with unpacked binary coded decimal	0x37
AAD	ASCII adjust AX before division	8086/8088 datasheet documents only base 10 version of the AAD instruction (opcode 0xD5 0x0A), but any other base will work. Later Intel's documentation has the generic form too. NEC V20 and V30 (and possibly other NEC V-series CPUs) always use base 10, and ignore the argument, causing a number of incompatibilities	0xD5
AAM	ASCII adjust AX after multiplication	Only base 10 version (Operand is 0xA) is documented, see notes for AAD	0xD4
AAS	ASCII adjust AL after subtraction		0x3F
ADC	Add with carry	destination := destination + source + carry_flag	0x100x15, 0x80/20x83/2
ADD	Add	(1) r/m += r/imm; (2) r += m/imm;	0x000x05, 0x80/00x83/0
AND	Logical AND	(1) r/m &= r/imm; (2) r &= m/imm;	0x200x25, 0x80/40x83/4
CALL	Call procedure	push eip; eip points to the instruction directly after the call	0x9A, 0xE8, 0xFF/2, 0xFF/3
CBW	Convert byte to word		0x98

- Process is too complex
- Expensive
- More energy requirement
- Not all instruction is used

RISC Instruction Set Architecture Reduced Instruction Set Computer MIPS (Microprocessor without Interlocked Pipelined Stages) Processors 1985 John L. Hennessy

MIPS Instruction Reference

This is a description of the MIPS instruction set, their meanings, syntax, semantics, and bit encodings. The syntax given for each instruction refers to the assembly language syntax supported by the MIPS assembler. Hyphens in the encoding indicate "don't care" bits which are not considered when an instruction is being decoded.

General purpose registers (GPRs) are indicated with a dollar sign (\$). The words SWORD and UWORD refer to 32-bit signed and 32-bit unsigned data types, respectively

The manner in which the processor executes an instruction and advances its program counters is as follows

1. execute the instruction at PC 2. copy nPC to PC

```
3. add 4 or the branch offset to nPC
```

This behavior is indicated in the instruction specifications below. For brevity, the function advance pc (int) is used in many of the instruction descriptions. This function is defined as follows:

void advance_pc (SWORD offset) PC = nPC; nPC += offset;

Note: ALL arithmetic immediate values are sign-extended. After that, they are handled as signed or unsigned 32 bit numbers, depending upon the instruction. The only difference between signed and unsigned instructions is that signed instructions can generate an overflow exception and unsigned instructions can not

The instruction descriptions are given below:

ADD – Add (with overflow)

```
Description: Adds two registers and stores the result in a register
Operation: $d = $s + $t; advance_pc (4);
Syntax
            add $d $s $t
```

PC in 80's – 90's

Assembly / C

BASIC

Pros

CISC	RISC
Easy to program (in assembly) Fast memory access	Low-cost Low power consumption
Small code size	Single cycle instruction

Cons

CISC	RISC
Expensive High power consumption Instruction can take several cycles	Large code size Ram Bottleneck Hard to program (in assembly)
Who still program in Assembly ?	

Smart compiler can overcome this problem!

RISC Instruction Set Architecture

Acorn Computers Ltd.

BBC Micro

Archimedes 400/1 series computer

- The official Acorn RISC Machine project started in October 1983.
- VLSI Technology as the *silicon partner*
- The first samples of ARM silicon worked properly when first received and tested on 26 April 1985
